AIR CLEANING CYCLE

1_Suction

Unhealthy air and dust are sucked up and conveyed inside the machine.

2_First filtering

Unhealthy air is subjected to a first filtering using water.

3_Filtering with separator

A second filtering operation is then carried out by the exclusive "molecular separator" that manages to intercept and reject even the smallest particles.

4_Output of clean air

These two natural filters expel healthy, clean and perfumed air.

AUTOMATIC SYSTEM

Automatic refilling

A high-pressure pump injects water directly into the boiler while always keeping the level constant when using steam. You can refill the tank even when the machine is switched on without losing time.

STEAM GENERATION

The boiler is one of the main components of the machine, steam is created inside it. Limescale is the boiler's main enemy, Maxima uses technology designed to help reduce the risk of clogging and malfunction.

1. Limescale removal injector for automatic refilling

2. Stainless Steel
